UNIT-2 Regular Expression

$L = L(M)$; If any language is regular in nature then it will be able to draw the machine.

$L_1 \cap L_2$ (both are regular)
$L_1 \cup L_2$
$L_1 \cdot L_2$
L_1^*

Defⁿ: A regular expression is recursively defined as follows:

1.) ϕ is a regular expression denoting empty language.
2.) ε -(Epsilon) is a regular expression denoting empty language string.
3.) 'a' is a regular expression denoting language containing only $\{a\}$.
4.) If α and β are regular expressions, then
   a.) $\alpha + \beta$ is also a regular expression corresponding to $L_\alpha \cup L_\beta$.
   b.) $\alpha \cdot \beta$ is also regular expression corresponding to $L_\alpha \cdot L_\beta$
   c.) α^* is also a regular expression to L_α^* (Kleene star / or closure)

NOTE: Nothing else is a Regular Expression.

Ex: The language $\{\Lambda, 00, 01, 000, 001, 010, 011, 0000, \ldots\}$ which consists all binary strings is regular.

$L = \{0\} \cdot \{0\}^* \cdot \{1\}^*$

$L = \{0\} \cdot (\{0\} \cdot \{1\})^*$

GOOD WRITE

To interpret the regular expression

$\Sigma^* = \{\lambda\}$

$\Sigma^+ \neq \{\lambda\}$

Regular Expressions	Meaning
$(a+b)^*$ →	Set of string of a's and b's any length including NULL string.
$(a+b)^* abb$ →	Set of string of a's and b's any length only ending with abb.
$ab(a+b)^*$ →	Set of string of a's and b's any length only starting with ab.
$(a+b)^* aa (a+b)^*$ →	Set of string of a's and b's any length containing substring aa.
$a^* b^* c^*$ →	Set of string a, b and c or may be a NULL string.
$a^+ b^+ c^+$ →	Set of string a, b, c may be or may not.
$aa^* bb^* cc^*$ →	Set of string of a's and b's any length including may or may not
$(a+b)^* (a+bb)$ →	Set of string of a's and b's ending with either a or bb.
$(aa)^* (bb)^* b$ →	Set of string of a's and b's ending or start with b or even no. of a's ~~and odd~~.

Q: R.E accepting a language consisting of strings of a's and b's of even length?

Ans: $(aa+ab+ba+bb)^*$ = Regular Expression

$L(R) = \{(aa+ab+ba+bb)^n \mid n \geq 0\}$

For odd length:

$RE = (aa+ab+ba+bb)^* (a+b) \;\big|\; (a+b)(aa+ab+ba+bb)^*$

GOOD WRITE — Even — either a or b

Q: R.E over the alphabet $\Sigma = \{a, b\}$

a) All strings that don't end with aa?

→ Arden's theorem:

Let two regular expressions P and Q defined over alphabet Σ.

If P ∉ ε (null string), then

$$R = Q + RP$$

has an unique soln

$$R = QP^*$$

PROOF: $R = Q + RP$

Put the value of R in R.H.S

$$R = Q + (Q + RP)P$$ put value

$$R = Q + QP + RP^2$$

again

$$R = Q + QP + QP^2 + RP^3$$

.
.
.

$$R = Q + QP + QP^2 + \cdots + QP^n + RP^{n+1}$$

.
.
.

$$R = Q(P^0 + P^1 + P^2 + \cdots)$$
$$= Q(\varepsilon + P^1 + P^2 + \cdots) \quad (\because \alpha^* = \alpha^0 + \alpha^1 + \alpha^2 + \cdots)$$

$$R = QP^*$$

DATE: __/__/____
PAGE _____

* Use of Arden's Theorem to find Regular expression of a DFA:

There are certain assumptions which are made regarding the transition system:

1) The transition diagram should not have 'ε' transition.
2) It must have only a single initial state.
3) Its vertices are $q_1, q_2, \cdots, q_n$.
4) Its final q_i is the final state.
5) w_{ij} denotes the R.E. representing the set of labels ↑ of edges from q_i to q_j. We can get the following set of equation in $q_1, q_2, \cdots, q_n$.

$$q_1 = q_1 w_{11} + q_2 w_{21} + \cdots + q_n w_{n1} + \varepsilon \quad \text{(1)}$$

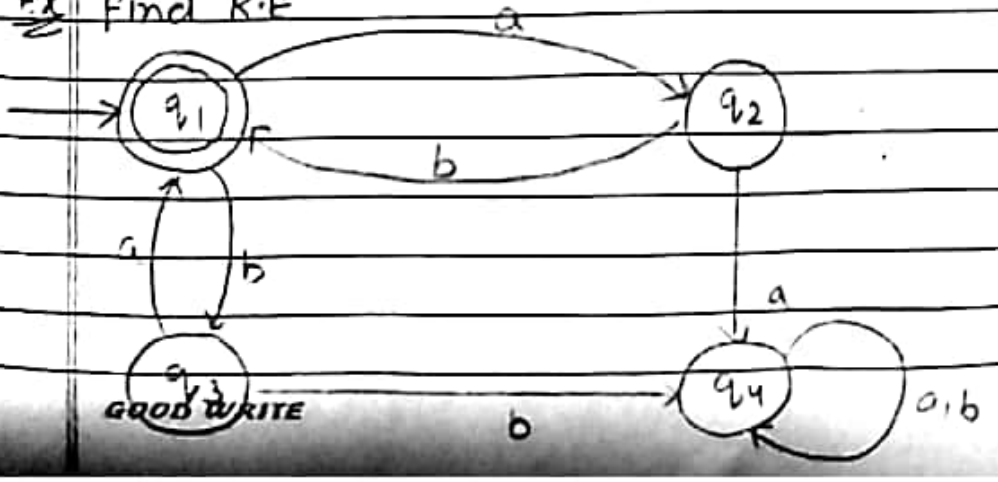
$$q_2 = q_1 w_{12} + q_2 w_{22} + \cdots + q_n w_{n2} + \varepsilon \quad \text{(2)}$$

.
.
.

$$q_n = q_1 w_{1n} + q_2 w_{2n} + \cdots + q_n w_{nn} \quad \text{(n)}$$

We solve these equations for q_i in terms of w_{ij} and it will be the required regular expression.

Ex Find R.E



$q_1 = q_2 b + q_3 a + 0 + \varepsilon = q_2 b + q_3 a + \varepsilon$

$q_2 = q_1 a + 0 + 0 + 0 = q_1 a$

$q_3 = q_1 b + 0 + 0 + 0 = q_1 b$

$q_4 = q_1 a + q_2 a + q_3 b + q_4 a + q_4 b$

$= q_2 a + q_3 b + q_4 a + q_4 b$

Now, final q_1 state

$q_1 = q_2 b + q_3 a + \varepsilon$

$= q_1 ab + q_1 ba + \varepsilon$

Then,

$q_1 = \varepsilon + q_1 ab + q_1 ba$

$q_1 = \varepsilon + q_1 (ab + ba)$

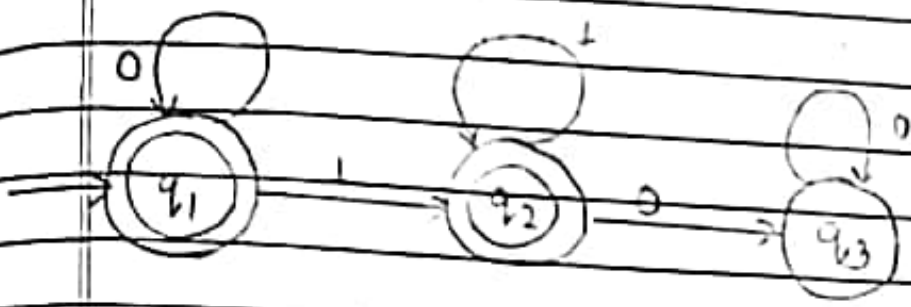
R Q R P

$q_1 = \varepsilon (ab + ba)^*$ $\quad (\because \varepsilon R = R\varepsilon = R)$

$\downarrow$

$q_1 = (ab + ba)^*$

Q: Describe in English the set of strings accepted by the following finite automata:



Ans: Now,

$$q_1 = q_1 0 + q_2 \times 0 + q_3 \times 0 \text{ if } = 0 q_1 + \varepsilon = q_1 0 + \varepsilon$$

$$q_2 = q_1 \times 1 + q_2 1 + q_3 0 = 1 q_1 + 1 q_2 = q_1 1 + q_2 1$$

$$q_3 = q_1 \times 0 + q_2 0 + q_3 0 + q_3 1$$

$$= q_2 0 + q_3 (0+1)$$

Now, we all know that in a given DFA there are two final state then,

$$q_1 = q_1 0 + \varepsilon$$
$$q_2 = q_1 1 + q_2 1$$

Then,

$$q_1 = \varepsilon + q_1 0 \Rightarrow q_1 = \varepsilon (0)^*$$

(R = Q + R P)

$$q_1 = 0^*$$

$$q_2 = q_1 1 + q_2 1 \quad \text{---} (1)$$

putting the value of 'q_1' in q_2

GOOD WRITE

$$q_2 = 0^* 1 + q_2 1 \Rightarrow q_2 = 0^* 1 (1)^*$$

(P = Q + P 1)

So, the required regular expression is

$= q_1 + q_2 = 0^* + 0^* 1^*$ (if no symbol is present with the string take ε)

$= 0^* (\varepsilon + 1^*)$

Using an identity,

$$\varepsilon + RR^* = R^*$$

Then,

$$q_1 + q_2 = 0^* (\varepsilon + 1\ 1^*)$$

$$\downarrow \quad \downarrow$$

$$R \quad R^*$$

$$= 0^* 1^*$$

→ Set of all strings with any number of 0's followed by any no. of 1's.

* Identities (I):

1.) $\phi + R = R$
2.) $\phi R = R\phi = \phi$
3.) $\varepsilon R = R\varepsilon = R$
4.) $\varepsilon^* = \varepsilon$
5.) $R + R = R$
6.) $R^* R^* = R^*$
7.) $RR^* = R^* R$
8.) $(R^*)^* = R^*$
9.) $\varepsilon + RR^* = R^*$
10.) $(PQ)^* P = P(QP)^*$
11.) $(P+Q)^* = (P^* Q^*)^* = (P^* + Q^*)^*$

GOOD WRITE

12) $(P+Q)R = PR+QR$

13) $R(P+Q) = RP+RQ$

→ PROVE THAT:

$(1+00^*1) + (1+00^*1)(0+10^*1)^*(0+10^*1) = 0^*1(0+10^*1)^*$

PROOF: L.H.S

$(1+00^*1)[\varepsilon + (0+10^*1)^*(0+10^*1)]$ Using 12th property

$= (1+00^*1)[\varepsilon + (0+10^*1)(0+10^*1)^*]$ (Using 7th property)

Now apply I_4

$= (1+00^*1)(0+10^*1)^*$

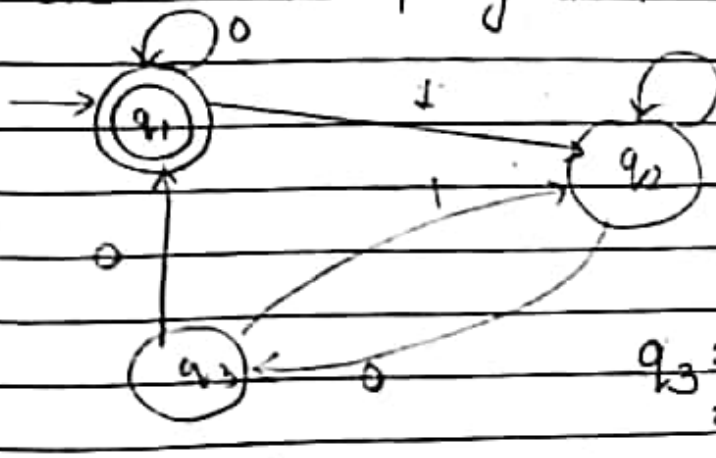
$= (\varepsilon + 00^*)1(0+10^*1)^*$ Using I_1, I_2,

$= 0^*1(0+10^*1)^*$ Using I_4

= R.H.S

Hence proved

→ Construct R.E for given FA:



Now,

$q_1 = q_1 0 + q_2 x 0 + q_3 0 + \varepsilon$

$= q_1 0 + q_3 0 + \varepsilon$ — ①

$q_2 = q_1 1 + q_2 1 + q_3 1$ — ②

If we are able to find out the expression/pattern for that particular language then it will be ——— Regular language.

DATE: __/__/____
PAGE _____

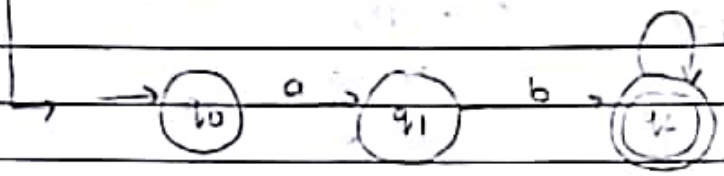
* Non-Regular language:

Some established theorem

Pumping lemma:

$L = \{(ab)^n \mid n \geq 1\}$ Regular

$L = \{a^p \mid p \text{ is prime no.}\}$ Non-Regular



(Here to include a self-loop or we have to increase the length by one step)

Let L is regular defined by some DFA having a constant 'n' (which depends on L) such that for every string w in L, $|w| \geq n$, we can break w into three strings, $w = xyz$, such that:

i) $|y| > 0$ i.e., $y \neq \varepsilon$

ii) $|xy| \leq n$

iii) $\forall\ i \geq 0$, the string xy^iz is also in L.

(For any language if it doesn't hold and not a Regular Expression)

* Method to prove a language L is not regular:

→ At first, we have to assume that L is regular.

→ So, the pumping lemma should hold for L.

→ Use the pumping lemma to obtain a contradiction-

1) Select w such that $|w| \geq n$.
2) Select y such that $|y| \geq 1$
3) Select x such that $|xy| \leq n$
4) Assign remaining string to z.
5) Select ~~suitably~~ suitably to show that resulting

GOOD WRITE

String is not in L.
Hence L is not regular.

DATE: __/__/____
PAGE _____

* Regular language:

Defn: Let M = (Q, Σ, q0, F, δ) be a DFA. The language L is regular if there exists a machine M such that L = L(M).

How to check a language is Regular or not?
How to answer the question?

Ans: If the language is finite then it is a Regular language.

Ex: L = {aa, ab, ba, bb} is a regular language because it is a finite language.
But infinite language can be regular or non-regular.

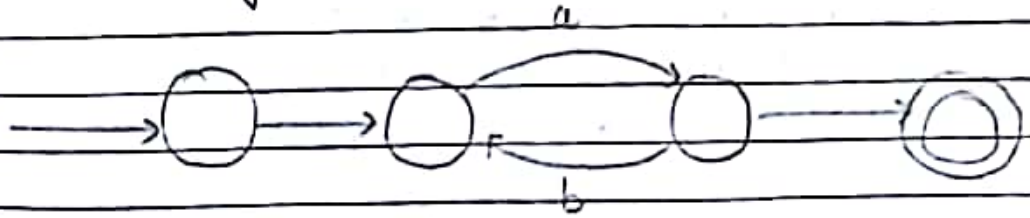
Ex: L = {ab, abab, ababab, ...} check regular or not?

Soln: In the infinite language there is some particular pattern which can be generated by applying some loop. Then we can say that the language is regular.

Like in above language ab is a kind of pattern which can be repeated by using a loop to generate such infinite language.

And if there is no such pattern available in the given language then, we can't able to generates its finite automata or we can say the language is not regular.
This is what Pumping Lemma says.

It means if we are not able to find some pattern then we can't design finite automata. On the other hand,

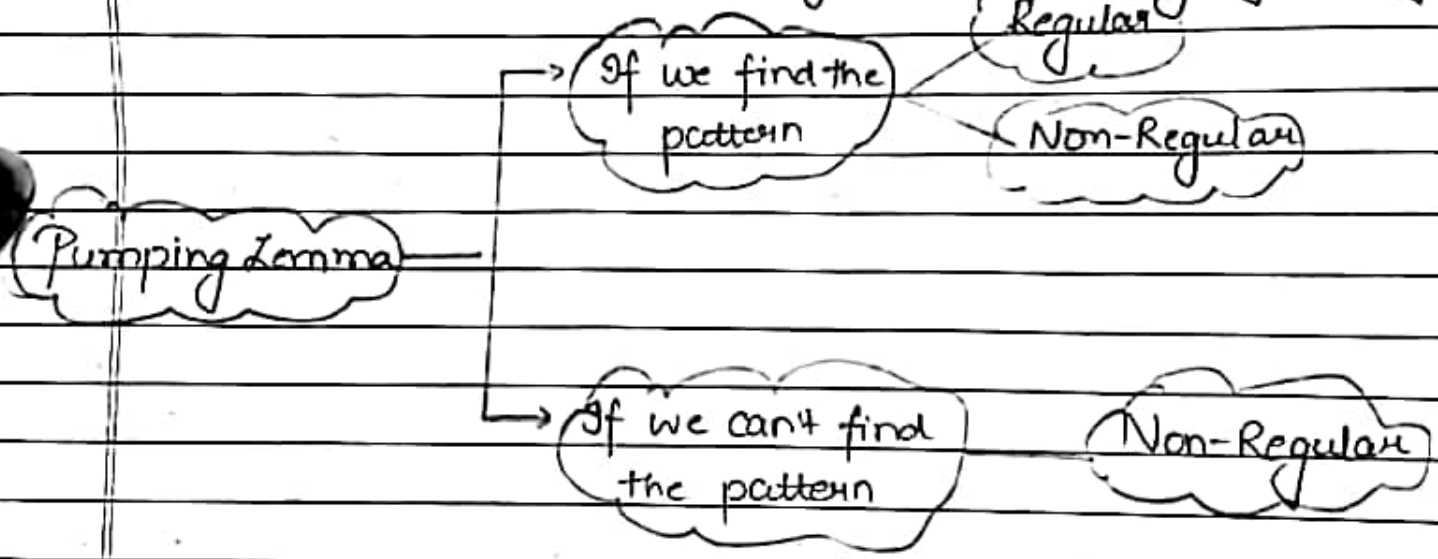


GOOD WRITE

If the infinite language has to be accepted by a finite automata then, there has to be a loop inside the automata, and if there is no such string or pattern which can be used with loop to generate infinite language then this is impossible to generate finite automata for such languages.

It means pumping lemma is a negative test.

If we don't find such pattern in the language then we can say that the ~~lemma~~ language is not regular, but finding such pattern doesn't assure you that the language is regular.



Hence, pumping lemma is -ve test.

Ex: $L = \{ a^p \mid p \text{ is prime} \}$

$p = 2, 3, 5, 7, 11, 13, 17, 19, \ldots$

No pattern in the language

Hence, Language is not - regular

* Pumping Lemma:

Let L be a regular language. Then there exists a constant (n) (which depends on L) such that for every string w in L, such that $|w| \geq n$, we can break w into three strings, $w = xyz$, such that:

1. $|y| > 0$ i.e., $y \neq \varepsilon$
2. $|xy| \leq n$
3. for all $i \geq 0$, the string xy^iz is also in L.

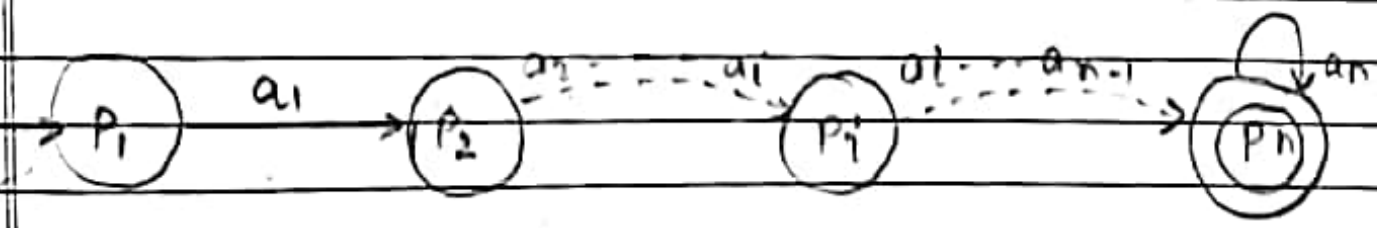
PROOF: Let L is a regular defined by some DFA, M having 'n' states. Let $w = a_1, a_2, a_3, \cdots a_n$ is in L.

$|w| = n \geq n$. Let the start state be P_1.

Let $w = xyz$, where $x = a_1, a_2, a_3, \cdots, a_{n-1}$

$y = a_n$

$z = \varepsilon$



$\delta(P_1, a_1) = P_2$
$\delta(P_2, a_2) = P_3$
.
.
.
$\delta(P_n, a_n) = P_{n+1}$

But there are only 'n' states
⇒ There must be a loop.
Let there be a loop in P_n state.
Let $x = a_1, \cdots, a_{n-1}$
$y = a_n$
$z = \varepsilon$

Therefore, $xy^iz = a_1 \cdots a_{n-1} (a_n)^i \varepsilon$

for $i = 0$, $a_1 \cdots a_{n-1}$ is accepted
for $i = 1$, $a_1 \cdots a_n$ is accepted
for $i = 2$, $a_1 \cdots a_{n+1}$ is accepted
.
.
.

for $i = 10$, $a_1 \cdots a_{n+9}$ is accepted and so on.

* **Uses of pumping lemma:**
Pumping lemma is to be applied to show that certain languages are not regular. It should never be used to show that some languages is regular.
→ If L is regular, it satisfies pumping lemma otherwise L is not regular.

* Prove that $L = \{a^n b^n \mid n \geq 1\}$ is not regular.
PROOF: At first, we assume that L is regular and n is the number of states.
→ Let $w = a^n b^n$. Thus $|w| = 2n > n$
Consider

$$w = \overbrace{aa\cdots a}^{n}\ \overbrace{bb\cdots b}^{n}$$
$$\vdash xy \dashv \vdash z \dashv$$

'xy' contain only a's. (Because $|xy| \leq n$)
Let $|y| = l$, where $l > 0$. (Because $|y| \geq 1$)

Then, the break up of x, y and z can be as follows

$$w = \underbrace{a^{n-l}}_{x}\ \underbrace{a^{l}}_{y}\ \underbrace{a^{n}}_{z}$$

from the definition of Pumping lemma,
$w = xy^i z$, where $i = 0, 1, 2, \cdots, \infty$, should $\in L$

GOOD WRITE

That is $a^{n-1}(a^1)^i b^n \in L$, $\forall\ i = 0, 1, 2, \ldots, \infty$,

Putting $i = 0$, we get

$a^{n-1} b^n \notin L$ (contradiction)

Hence, the language L is not regular.

* Prove that $L = \{w \mid w \text{ is a palindrome on } \{a,b\}^*\}$ is not regular.

PROOF: Given $L = \{aabaa, aba, abbbba, \ldots\}$

Let L be regular and n is a constant (number of states)

Let $w = a^n b a^n$, such that $|w| = 2n+1 > n$ and L is regular it must satisfy pumping lemma.

Consider,

$$w = \underbrace{aa\ldots a}_{n}\ b\ \underbrace{aa\ldots a}_{n}$$
$$\vdash xy \dashv\vdash z \dashv$$

xy contains only a's. (Because $|xy| \leq n$)

Let $|y| = 1$, where $1 > 0$. (Because $|y| > 0$)

Then, the break up of x, y and z can be as follows

$$w = \underbrace{a^{n-1}}_{x}\ \underbrace{a^1}_{y}\ \underbrace{ba^n}_{z}$$

from the definition of pumping lemma,

$w = xy^iz$, where $i = 0, 1, 2, \ldots, \infty$, should $\in L$.

That is, $a^{n-1}(a^1)^i b a^n \in L$, $\forall\ i = 0, 1, 2, \ldots, \infty$.

Putting $i = 0$, we get

$a^{n-1} b a^n \notin L$. (Because it is not a palindrome)

Contradiction, hence the language is not regular.

17/03/18

* Closure properties of Regular languages:

1) The union of two regular language is regular - Closure under union

Theorem: If L and M are two regular language then so L∪M is also regular.

PROOF: $L_1 = \{a, a^3, a^5, ---\}$

$L_2 = \{a^2, a^4, a^6, ---\}$

$L_1 \cup L_2 = \{a, a^2, a^3, ---\}$

$R.E = a(a^*) = a^+ \quad \{\overline{L} = \Sigma^* - L\}$

$L_1 \cap L_2 = \phi \qquad \Sigma = \{a\}$

$\overline{A} = U - A \qquad \overline{L} = \{\lambda, a, a^2, a^3, \ldots\}$

2.) Intersection is also a R.E.

3.) The complement of a regular language is also regular closure under intersection.

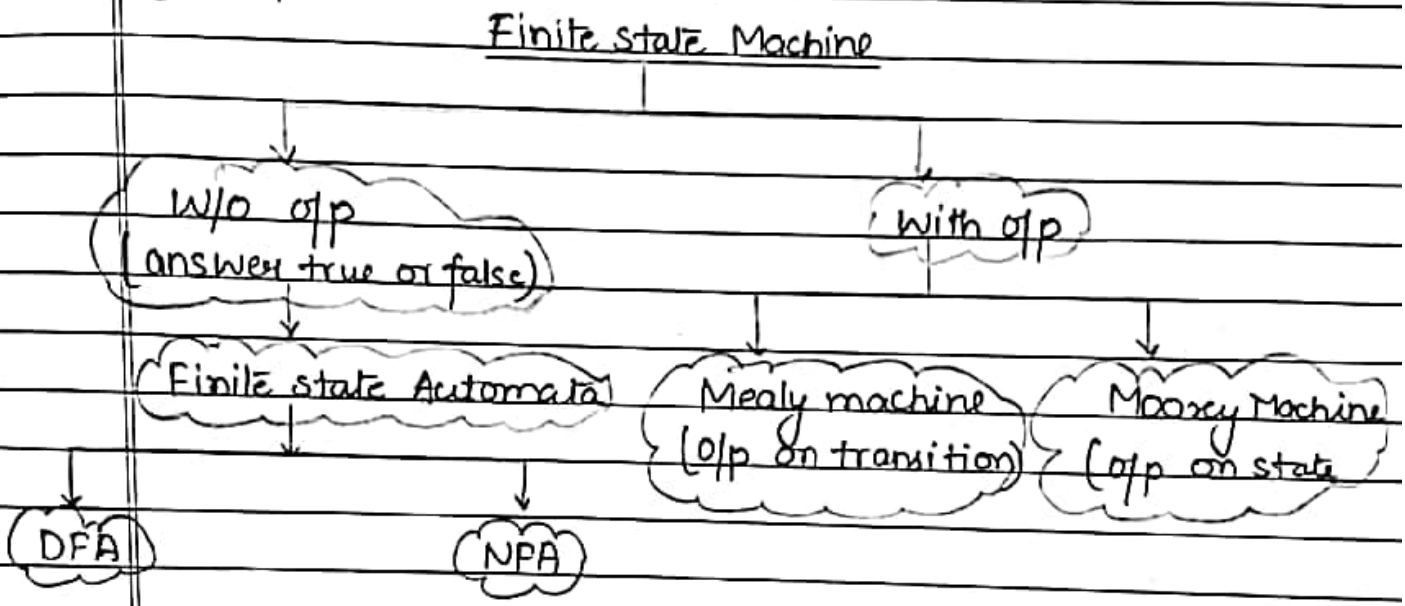
* What is a FSM?

A finite state machine is a machine that has some many states and has a logical way of changing from one state to another state under guiding rules.

* Types of FSM



* Mealy Machine: A Mealy Machine is an FSM whose o/p depends upon the present state as well as present i/p. In a mealy machine, every transition for a particular i/p symbol has a fixed o/p.

It can be described by a 6-tuple:

$M_e = (Q, \Sigma, O, \delta, X, q_0)$

* Q is a finite set of states
Σ is a finite set of symbols called I/p alphabet.
O is a finite set of symbols called o/p alphabet.
δ is the i/p transition fn where $\delta : Q \times \Sigma \to Q$
X is the o/p transition fn where $X : Q \times \Sigma \to O$
q_0 is the Initial state ($q_0 \in Q$)

GOOD WRITE

-> No final state is present in it

DATE: __/__/____

DFA Minimization (DFA)

The task of DFA minimization then, is to automatically transform a given DFA into a state-minimized DFA.

→ Several algorithms and variants are known
→ Note that this also in effect can minimize a NFA (Equivalence relation of NFA & DFA).

→ DFA minimization Algorithm:

1.) Recall that a DFA $M = (Q, \Sigma, \delta, q_0, F)$
2.) Two states p and q are distinct if
→ p in F and q not in F or vice-versa.
→ For some α in Σ, $\delta(p, \alpha) = q'$ and $\delta(q, \alpha) = q''$ are distinct.

$q' \neq q'' \in Q$

3.) Using this inductive definition, we can calculate which states are distinct.

Algorithm

1) Create lower-triangular table Distinct (Name), initially blank.

⇒ for every pair of states (p,q):
1.) if p is final and q is not or vice versa
Distinct (p,q) = ε

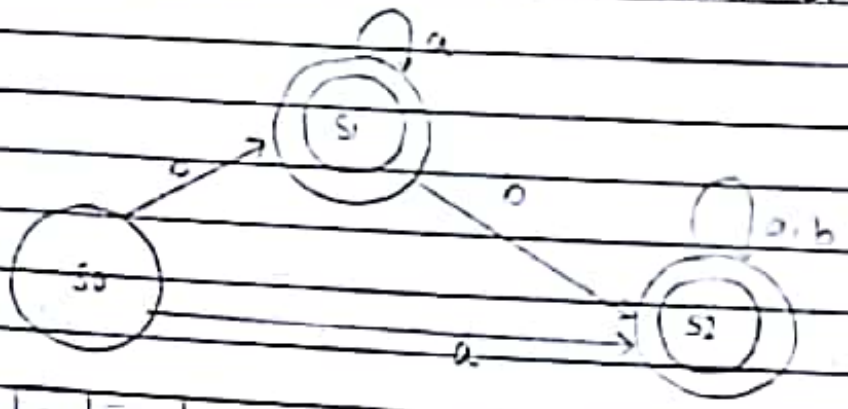
2) Loop until no change for an iteration:
1.) For every pair of states (p,q) and each symbol

GOOD WRATE

→ if Distinct (p,q) is blank and
DISTINCT $(\delta(p,\alpha), \delta(q,\alpha))$ is not ~~block~~ blank
DISTINCT $(p,q) = \alpha$

⇒ Combine all states that are not distinct.

Eg



S_0			
S_1			
S_2			
	S_0	S_1	S_2

$S_1 \in F$
$S_0 \notin F$

S_0			
S_1	ε		
S_2	ε		
	S_0	S_1	S_2

→

S_0			
S_1	ε		
S_2	ε		
	S_0	S_1	S_2

Now, merge (S_1, S_2) we get,

CONTEXT-FREE GRAMMAR

To generate a language with the help of some grammer rules.

→ 4 Tuple (or) a quadruples, NTPS

Defn: A Context-free grammer (CFG) consisting a finite set of grammer rules is a quadruple.

$G = (N, T, P, S)$, where

* N: is a finite set of non-terminal symbols (usually represented by capital letters A, B, S ...)
* T: is a finite set of terminal symbols (usually represented by small letters (a, b, 0, 1, ... ε, etc))
* P: is a set of rules or productions in CFG.

$$P: N \rightarrow (N \cup T)^*$$

* S: Starting non-terminal symbol, called start symbol. ($S \in N$) of the grammer.

$N \cap T = NULL$

Ex: The Grammer $(\{A\}, \{a, b, c\}, P, A)$

$P: A \rightarrow aA, \quad A \rightarrow abc$

$N = \{A\}$

$T = \{a, b, c\}$

$S = \{A\}$

but when we include another cond^n, $a \rightarrow Ba$

it doesn't satify the above mentioned cond^n

Not a CFG.

Ex: The Grammar $(\{S, F\}, \{0, 1\}, P, S)$

$P: S \to 00S \mid 11F$, $F \to 00F \mid \varepsilon$

Sol: $N = \{S, F\}$

$T = \{0, 1\}$

$S = \{S\}$

There are 4 productions such as

$P: S \to 00S$

$P: S \to 11F$

$P: F \to 00F$

$P: F \to \varepsilon$

Hence, it is CFG.

* Language of a CFG:

If $G = (N, T, P, S)$ is a CFG, the language of 'G' denoted by $L(G)$ is the set of terminal strings that have derivations from the start symbol.

$$L(G) = \{ \omega \in T \mid S \overset{*}{\underset{G}{\Rightarrow}} \omega \}$$

If a language L is a language of some context-free grammar, then L is said to be a context-free language (CFL).

Q: The Grammar $(\{S\}, \{a, b\}, P, S)$

$P: S \to aSb, S \to ab$

Sol: $N = \{S\}$

$T = \{a, b\}$

GOOD WRITE

DATE : __/__/____

q_{20}	$q_{21}/1^-$	$q_{20}/0^*$	0
q_{21}	$q_2/1^-$	$q_{20}/0^-$	1
q_3	$q_{10}/0^-$	$q_0/1^-$	0

Imp

* Chomsky Normal form: CNF

A CFG in which productions are of the form:

- $A \rightarrow BC$
  OR Exactly two non-terminals
- $A \rightarrow a$
  Single terminal symbol

Ex: $S \rightarrow 1A \mid 0B$
$A \rightarrow 1AA \mid 0S \mid 0$
$B \rightarrow 0BB \mid 1$
in each of the following which is in CNF form

Q2 $A \rightarrow 0$ is in CNF form (A/c to the production form)
$B \rightarrow 1$ is in CNF form

Rewrite:

$S \rightarrow 1A$
$S \rightarrow C_1A$ } CNF
$C_1 \rightarrow 1$

$S \rightarrow 0B$
$S \rightarrow C_0B$ } CNF
$C_0 \rightarrow 0$

$A \rightarrow 1AA$
$A \rightarrow C_1C_A$ } CNF
$C_1 \rightarrow 1$
$C_A \rightarrow AA$

$A \rightarrow 0S$
$A \rightarrow C_0S$ } CNF
$C_0 \rightarrow 0$

$B \rightarrow 0BB$
$B \rightarrow C_0C_b$ } CNF
$C_0 \rightarrow 0$
$C_b \rightarrow BB$

Simplification:

$S \to C_1A \mid C_0B$

$A \to C_1C_a \mid C_0S \mid 0 \Rightarrow A \to C_1C_a \mid C_0S \mid 0$

$B \to C_0C_b \mid 1 \Rightarrow B \to C_0C_b \mid 1$

Ex: $L = \{a^n \mid n >= 1\}$, Find CFG and convert it into CNF.

$L = \{a, aa, aaa, aaaa, \ldots\}$

Ex: $L = \{a^{4n} \mid n >= 1\}$, Find CFG and convert it into CNF

Sol: $n = 1$, $L = \{aaaa\}$

$n = 2$, $L = \{aaaa\,aaaa\}$

$L = \{aaaa, \ldots\}$

$N = \{S\}$, $T = \{a\}$

P: $N \to (NUT)^*$

p: $S \to aaaaS$

$S \to aaaa$

* Rewrite:

CNF form:

$S \to AR_1$

$R_1 \to AR_2$

$R_2 \to AR_3$

$R_3 \to AS$

$A \to a$

CNF:

$S \to AR_4$

$R_4 \to AR_5$

$R_5 \to AA$

$A \to a$

Q: Convert into CNF:

$S \to bA \mid aB$

$S \to bA$

$S \to C_bA$ } CNF

$C_b \to b$

$S \to aB$

$S \to C_aB$ } CNF

$C_a \to a$

$A \to bAA \mid as \mid a$

$A \to bAA$

$A \to C_bC_A$ } CNF

$C_b \to b$

$C_A \to AA$

$A \to aS$

$A \to C_aS$ } CNF

$C_a \to a$

$A \to a$ (CNF)

* $B \to aBB \mid bS \mid b$

$B \to aBB$

$B \to C_aC_B$ } CNF

$C_a \to a$

$C_B \to BB$

$B \to bS$

$B \to C_bS$ } CNF

$C_b \to b$

$B \to b$ (CNF)

* Greibach Normal form:

$A \to a\alpha \mid a$

α → string of none or more variable (NT)

↳ Exactly one terminal

Ex: $A \to aB$ Greibach NF (GNF)
